Subject: Update on 4.29.14 NOA meeting

Hi everyone:

Thank you to those of you who were able to gather and talk this morning. Attached is my very messy mish mash of what I thought could be helpful web links, parts of text cut and pasted from good handouts, snippets from exposure studies, and some of my own thoughts from my fall of 2013 effort to try to get my head around what might be useful in a website on NOA. I passed this off to Joanne S. of DOH a while ago in case she found it helpful and she suggested that I share it with the group. It is a mess but has most of the useful links in it. It is in no way a product of any sort, just a brain storm of sources to use to create a final product.

Regarding our discussion this morning, we left with the following intent (correct me if I am wrong):

- Joanne Snarski will continue to work on expanding the Washington State Department of Health web information on NOA so that it better applies throughout the state. At this time it contains good information but is very focused on Swift Creek in Whatcom County.
- Joanne is also working to get NOA information resources incorporated into the state SEPA checklist.
- Dave Norman has linked NOA maps on the DNR Geologic Hazards web page. At this time the maps just show colored areas overlaid on a blank state map, no features to better place locations. He intends to have layers available in the near future that would provide better location information (roads, etc.). He has probably been greatly side tracked by the Oso slide so perhaps we should check back with him in early summer?
- Julie O'Shaughnessy will work with Katie Skipper to try to create a one or two page handout that could be used by building and permitting departments within the NWCAA jurisdiction to provide the public with information and web resources in the event that they have a concern or are building, etc. in an area of concern for NOA.
- I intend to add a section into our county environmental health web page on geologic hazards (including NOA) once the DOH webpage and the DNR maps are updated as discussed above.
